

Introduction to Atomic Simulation Environment (ASE)

- Setting up, steering and analyzing: Python based
- Supports many Calculators/Software
- Easy to use (GUI, CLI)
- Open-source and cross-platform
- Data Analysis tools
- Movie making and Images

```
$ ase --help
$ ase sub-command --help
$ python -m module --help
```

Installation

- Linux: apt-get install python-ase
- Python: pip3 install --upgrade --user ase

Import required modules

```
from ase import Atoms
from ase.build import add_adsorbate, fcc111
from ase.calculators.emt import EMT
from ase.constraints import FixAtoms
from ase.optimize import QuasiNewton

h = 1.85
d = 1.10

slab = fcc111('Cu', size=(4, 4, 2), vacuum=10.0)
```

Example Script

```
from ase import Atoms
from ase.build import add_adsorbate, fcc111
from ase.calculators.emt import EMT
from ase.constraints import FixAtoms
from ase.optimize import QuasiNewton

h = 1.85
d = 1.10

slab = fcc111('Cu', size=(4, 4, 2), vacuum=10.0)

slab.calc = EMT()
e_slab = slab.get_potential_energy()

molecule = Atoms('2N', positions=[(0.0, 0.0, 0.0), (0.0, 0.0, d)])
molecule.calc = EMT()
e_N2 = molecule.get_potential_energy()

add_adsorbate(slab, molecule, h, 'ontop')
constraint = FixAtoms(mask=[a.symbol != 'N' for a in slab])
slab.set_constraint(constraint)
dyn = QuasiNewton(slab, trajectory='N2Cu.traj')
dyn.run(fmax=0.05)

print('Adsorption energy:', e_slab + e_N2 - slab.get_potential_energy())
```

create slab

calculate potential energy

add N2 on slab

run dynamics

EMT(): simple calculator that can be used for quick demonstrations and tests

```
python N2Cu.py
```

Wide range of Calculators

Supported Calculators

```
[8]: #slab_vth_benzene.center(vacuum=5.0)
slab_vth_benzene.set_pbc([True, True, True])
slab_vth_benzene.calc = EMT() # Basic All-atom force field based

# calc = CP2K(label='benzene',
#             cutoff=250,
#             basis_set='SZV-MOLOPT-GTH',
#             pseudo_potential='auto',
#             charge=0,
#             xc='PBE',
#             print_level='LOW',
#             max_scf=20)
#slab_vth_benzene.calc = calc
```
